GUJARAT TECHNOLOGICAL UNIVERSITY B. E. - SEMESTER – IV • EXAMINATION – WINTER 2012

Subject code: 140502Date: 28/12/2012Subject Name: Chemical Engineering Thermodynamics - ITime: 02.30 pm - 05.00 pmTotal Marks: 70

Instructions:

- 1. Attempt any five questions.
- 2. Make suitable assumptions wherever necessary.
- 3. Figures to the right indicate full marks.
- Q.1 (a) Discuss pdV-work or displacement work with diagram and explain path 07 function and point function with example
 - (b) Discuss different forms of stored energy and show that the Energy is a 07 property of the system.
- Q.2 (a) Define enthalpy with its units and discuss specific heat at constant 07 pressure in terms of enthalpy
 - (b) A stationary mass of gas is compressed without friction from an initial 07 state of 0.3 m³ and 0.105 MPa to a final state of 0.15m³ and 0.105 MPa, the pressure remaining constant during the process. There is a transfer of 37.6 kj of heat from the gas during the process. How much does the internal energy of the gas change?

OR

- (b) Discuss the *P-V-T* behaviour of pure liquids with PT diagram for a pure 07 material.
- Q.3 (a) Define standard heat of reaction, standard heat of combustion and 07 standard heat of formation with example
 - (b) A vapour-compression cycle using ammonia as refrigerant is employed in 07 an ice manufacturing plant. Cooling water at 288 K enters the condenser at a rate of 0.25 kg/s and leaves at 300 K. Ammonia at 294 K condenses at a rate of 0.5 kg/minute. Enthalpy of liquid ammonia at 294 K is 281.5 kj/kg. The compressor efficiency is 90%. Saturated ammonia vapour at 258 K and enthalpy of 1426 kj/kg enters the compressor. What is the power requirement of the compressor and refrigeration capacity in tons?

OR

- Q.3 (a) Explain the principle of corresponding states and discuss the generalized 07 compressibility chart
 - (b) A vapour compression refrigeration system with ammonia as the working 07 fluid is to operate between 266 K and 300 K. Determine(a) COP, given that the enthalpy of saturated vapour at 266 K = 656 kj/kg and enthalpy of superheated vapour leaving the compressor = 724 kj/kg, enthalpy of saturated liquid at 300 K = 144 kj/kg
 (b) COP of an ideal Carnot refrigerator
- Q.4 (a) Discuss the important properties to be considered during the choice of a 07 refrigerant
 - (b) Discuss the vapour compression cycle with the diagram of components of 07 vapour-compression cycle

- Q.4 (a) Define refrigeration, coefficient of performance (COP) and refrigeration 07 capacity. Show schematic representation of refrigeration cycle
- Q.4 (b) Explain the principle of absorption refrigeration with diagram and discuss 07 absorption refrigeration cycle.
- Q.5 (a) State the Joule-Thomson Coefficient and explain the Joule-Thomson 07 inversion curve
 - (b) The molar volume of an organic liquid at 300 K and 1 bar is $0.1 \text{ m}^3/\text{Kmol}$ 07 and its coefficient of expansion is $1.25 \times 10^{-3} \text{ K}^{-1}$. What would be the change in entropy if the pressure is increased to 20 bar at 300 K? What assumption is involved in the solution?

OR

- Q.5 (a) Derive the steady flow energy equation (S.F.E.E) for a steady flow 07 process
 - (b) Derive first of the four Maxwell's Equations and state its application in 07 thermodynamics
