# **GUJARAT TECHNOLOGICAL UNIVERSITY BE - SEMESTER-V • EXAMINATION – WINTER 2013**

Subject Code: 151403 Date: 29-11-2013 Subject Name: Food Refrigeration and Air Conditioning Time: 10.30 am - 01.00 pm **Total Marks: 70 Instructions:** 1. Attempt all questions. 2. Make suitable assumptions wherever necessary. 3. Figures to the right indicate full marks. 0.1 (a) Answer the following questions: 07 (i) Write 'R' designations for refrigerants CO<sub>2</sub> and CH<sub>4</sub> (ii) Enumerate the safety criteria for selection of refrigerants. (iii) Define I TON of refrigeration and show that 1 TR = 3.5167 kW. (iv) Define azeotropes and give examples. (v) Why is it desirable for refrigerants to have high critical temperatures? (vi)Why is actual COP always less than Carnot COP? (vii) What is the main function of expansion valve in refrigeration cycles. (b) A R134a based simple vapour compression refrigeration system is operating on the 07 following conditions: Refrigeration capacity = 20 TR, Evaporating temperature = -12 °C Condensing temperature =  $36 \,^{\circ}$ C, Compressor discharge temperature =  $42 \,^{\circ}$ C Avg. Specific heat of superheated vapours = 1.12 kJ/kgK, COP of the system = 4.5Calculate the following: (i) Mass flow rate of the refrigerant in kg/s. (ii) Compressor power requirement in HP. (iii) Quality of refrigerant vapours entering the evaporator. (iv) Heat rejected at Condenser in kW (v) Carnot COP of the system. (vi) Refrigeration efficiency in % (vii) If  $\eta_{vol} = 92\%$ , calculate actual piston displacement in lps. Thermodynamic Properties of R-134a  $C_{Pv}$ Ρ t hg  $h_{f}$ Sg  $\mathbf{S_{f}}$  $\rho_{\rm f}$ Vg m<sup>3</sup>/kg kg/m<sup>3</sup> kJ/kg kJ/Kkg  $(^{\circ}C)$ kJ/kg kJ/Kkg kJ/Kkg bar

(a) Draw a neat and labeled diagram of a Vapour Absorption Cycle. Explain in detail 07 Q.2 the function of various components of this cycle and also write down the expression of its COP.

- (b) With the help of a neat flow diagram, explain the operation of a simple vapour 07 compression cycle. Draw P-h & T-s phase diagrams for the cycle indicating various state points. Explain the effect of the following factors on the performance of vapour compression cycle:
  - (i) Evaporator pressure
  - (ii) Condenser temperature
  - (iii) Suction vapour superheat
  - (iv)Liquid sub-cooling

### OR

(b) Explain the operation of a simple vapour compression refrigeration system with 07 the help of a neat flow diagram explaining functions of different components. Also draw P-h & T-s phase diagrams for the process indicating various state points. On the basis of these diagrams, write down expressions for Refrigeration effect and COP of the system. Why is it recommended to slightly superheat the refrigerant vapours before it enters the compressor and sub-cool it at the condenser exit?

## Q.3 (a) Write brief notes on the following with figures wherever required:

05

- (i) Electronic air filters
- (ii) Radial flow fans
- (iii) Limit switches
- (iv)Automatic humidity control
- (v) Aspect ratio of ducts
- (b) State general rules for air flow duct design and discuss the materials suitable for duct construction. What materials of construction do you consider suitable for food processing plants?
- (c) State fan laws. A fan driven by a 70% efficient constant speed motor delivers 6 05 m<sup>3</sup>/s of air against a static head of 60 mm WC at a location where the specific gravity of air is 0.96. The same fan is operated at a place where the specific gravity of the air is 1.18. Calculate
  - (i) air flow rate in  $m^3/s$ ,
  - (ii) static head in mm WC
  - (iii) required motor shaft HP

#### OR

- Q.3 (a) Write brief notes on the following with figures wherever required:
  - (i) Wet air filters
  - (ii) Axial flow fans
  - (iii) Time switches
  - (iv)Automatic temperature control
  - (v) Pressure measurement elements
  - (b) State general requirements for good room air distribution in air-conditioned space 04 meant for storage of different type food products. With the help of a schematic layout diagram, illustrate the operation of an automatic pressure control device starting from sensor to controller.
  - (c) Work out mass and energy balance equations for air flowing through ducts. A 05 motor driving a fan is rated at 15 Ampere. When the fan runs at an angular velocity of 15 radian/s, it draws a current of 11 Ampere. Calculate the maximum permissible angular velocity at which the fan could be operated within its rated capacity. What would be the percentage increase in air flow?

05

- Q.4 (a) Write down the differences between:
  - i. Centrifugal compressor & Reciprocating compressor
  - ii. Plate surface evaporator & Finned tube evaporator
  - iii. Thermostatic expansion valve & solenoid expansion valve
  - iv. Air cooled condenser & water cooled condenser
  - (b) Define and differentiate between freezing, refrigeration and chilling. Draw a 07 typical freezing curve for foods and explain in detail the path followed.

#### OR

- Q.4 (a) Define the following. (i) IQF (ii) COP (iii) DBT (iv) ODP (v) GWP (vi) WBT (vii) % RH
  - (b) Enlist different types of freezers used in Food Industry. Explain in detail the 07 immersion freezing technique with the help of a diagram. Also state its advantages.
- Q.5 (a) Explain the construction and working of an Electrolux refrigeration system. Also 07 write down the expression of its COP.
  - (b) Enlist the factors responsible for the spoilage of fruits and vegetables. Also 07 explain in detail the methods which can be employed for its control.

#### OR

- Q.5 (a) In a vapour absorption system, heating, cooling and refrigeration takes place at 07 temperatures of 100°C, 20°C and -50°C respectively. Find the maximum COP of the system. Also write down the differences between Vapour compression and Vapour absorption cycle.
  - (b) State the significance of a cold storage of fruits and vegetables. Describe the **07** factors to be considered while designing a cold storage?
